Dynek

Your Dental Suture Experts

Dynek is a leading suture manufacturer in Australia, renowned for a commitment to surgical excellence and innovation. We craft premium absorbable and non-absorbable sutures, many of which are ideally suited for dental, oral, and oral maxillofacial surgeries.

Since 1974, our singular focus on the unique needs of medical professionals, along with the excellence of our products, have been key to our reputation as a world class manufacturer and supplier of surgical suture products.

Trust Dynek for high quality sutures and excellent patient outcomes.

Manufacturing Australian sutures for the world since 1974

Made in Australia

Synthetic Absorbable Dyed (violet) or undyed (beige) braided multifilament coated polyglycolide (PGA)

An alternative to

- Ethicon Vicryl®*
- Medtronic Polysorb®
- Braun Novosyn®
- LOOK Polysyn®

*Biovek[®] is also a possible alternative to Ethicon Vicryl Rapide[®] with slightly longer absorption and wound support.

Day of surgery

Day of surgery

14 days post-surgery

All-On-4[®] procedure

Features

- Optimum mid-term wound support
- Coated for smooth passage and minimal tissue trauma
- Coated material provides a uniform absorption profile
- Excellent knot run down and knotting capabilities
- Also available in a range of micro needles
- Uniform absorption thorough hydrolysis provides predictable absorption irrespective of patient health:

Tensile Strength	70%	35%
Days	14	21
Complete Absorption	60 - 90	days

Potential dental procedures*

- Surgical extractions
- Implant surgeries
- All-On-4[®] procedures
- Biopsies
- Oral maxillofacial surgeries
- Other dental procedures as deemed appropriate * Choice of suture is at the discretion of the surgeon

Available and popular Biovek[®] product codes and specification

Monovek®

Synthetic Long-term Absorbable

Dyed (violet) monofilament polydioxanone(PDO)

An alternative to

Day of surgery

Day of surgery

21 days post-surgery

- Excellent long term tensile strength
- Ideal absorbable suture when extended wound support is required
- Monofilament structure provides smooth passage and minimal tissue trauma
- Excellent knot run down and knotting capabilities
- Uniform absorption thorough hydrolysis provides predictable absorption irrespective of patient health:

Tensile Strength	75%	65%	50%		
Days	14	28	49		
Complete Absorption	6 months				

Potential dental procedures*

- Implant surgeries with bone graft
- Guided bone regenerations (GBR)
- Sinus fenestrations
- Mucoperiosteal flaps
- All-On-4[®] procedures
- Cleft lip and palate surgeries
- Other dental procedures as deemed appropriate
- * Choice of suture is at the discretion of the surgeon

Chromic Catgut

Natural Absorbable

Monofilament chromic surgical catgut

An alternative to

• Ethicon catgut

Day of surgery

Features

- Manufactured by Dynek since 1974
- Smooth, supple, soft, and pliable
- Optimal tensile strength in vivo performance
- Monofilament structure provides smooth passage and minimal tissue trauma
- Excellent knot run down and knotting capabilities
- A specialised spinning and grinding process creates chromic gut suture strands of uniform diameter
- The chromic gut suture strands are further polished to achieve excellent smoothness for reliability and strength
- Uniform diameter of chromic gut suture strands allows for an even absorption rate
- Chromic gut is chromicised before it is spun for a longer absorption rate
- Absorption through enzyme digestion:

Chromic	20 to 40 days
---------	---------------

NOTE: Suture packet must only be opened *and* the suture only removed at the time of surgery to prevent the chromic gut suture strand from drying out

Available and popular Chromic Catgut product codes and specification

Plain Catgut

Natural Absorbable

Monofilament plain surgical catgut

An alternative to

- Ethicon catgut
- Braun Monosyn[®] (synthetic)

Day of surgery

- Manufactured by Dynek since 1974
- Smooth, supple, soft, and pliable
- Optimal tensile strength in vivo performance
- Monofilament structure provides smooth passage and minimal tissue trauma
- Excellent knot run down and knotting capabilities
- A specialised spinning and grinding process creates plain gut suture strands of uniform diameter
- The plain gut suture strands are further polished to achieve excellent smoothness for reliability and strength
- Uniform diameter of plain gut suture strands allows for an even absorption rate
- Absorption through enzyme digestion:

Plain	7 to 10 days

NOTE: Suture packet must only be opened *and* the suture only removed at the time of surgery to prevent the plain gut suture strand from drying out

Dyloc[®]

Synthetic Non-absorbable

Blue monofilament polyether-ester elastomer (polyester)

An alternative to

- Medtronic Novafil®
- Silk
- Nylon
- Cytoplast PTFE

Day of surgery

Day of surgery

14 days post-surgery

Features

- Smooth, supple, soft, and pliable
- Extremely low memory prevents knotting and tangling during removal from suture packet
- Thermo-elastic properties:
 provide excellent tying, handling, and knotting capabilities
 - allow expansion and contraction during healing
 lead to suture softening in the mouth resulting in greater patient comfort
- High tensile strength *in situ* allows smaller diameter thread to be used for excellent cosmetic results
- Monofilament structure:
 provides smooth passage and minimal tissue trauma
 leads to tissue not infiltrating or attaching to thread
- Suitable for procedures where PTFE, EPTFE, nylon and silk sutures are used where thermos-elasticity is preferred

Available and popular Dyloc[®] product codes and specification

Contact us for any other suture specifications and availability

Vilene®

Synthetic Non-absorbable

Blue monofilament polyvinylidene fluoride (PVDF)

An alternative to

- Ethicon Prolene®
- Medtronic Surgipro[®] II
- Braun Premilene[®]
- Cytoplast PTFE
- Nylon

Day of surgery

Day of surgery

Healing complete

Features

- Smooth, fray-free, and supple - Will not fray or fracture if handled correctly
- Very low memory, with the curves straightening out when the thread is gently pulled
- Low frictional characteristics facilitating excellent knot-tying
- Has very little elasticity
- Physiologically very inert
- Very high tensile strength *in situ* allows smaller diameter thread to be used for excellent cosmetic results
- Monofilament structure:
 provides smooth passage and minimal tissue trauma
 leads to tissue not infiltrating or attaching to thread
- Suitable for procedures where PTFE, EPTFE, nylon, and polypropylene sutures are used

Potential dental procedures*

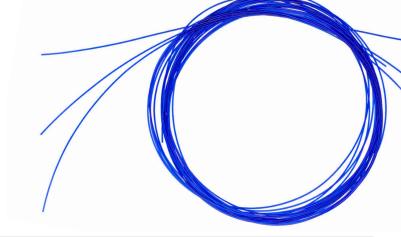

- Apicoectomies
- Hemisections
- Bicuspidization
- Periodontal surgeriesGum reconstructive
 - surgeries
 - Implant surgeries
 Other dental procedures as deemed appropriate
 - * Choice of suture is at the discretion of the surgeon

How to interpret Dynek suture packets

How to interpret Dynek code numbers

The codes convey three pieces of information:

- A. The first letter(s) refer to the material.
- B. The next number(s) refer to the USP thread size.
- C: The final number(s) refer to the needle code.

* If 1 precedes the thread size, this indicates a longer thread length than the standard. For example, N306 has a 45cm thread, whereas N1306 has a 76cm thread.

- The information contained in this document is intended as a guide only.
- Always refer to the instructions for use when using Dynek sutures.
- All Dynek sutures are included on the ARTG (AU) and Medsafe (NZ).
- All Dynek sutures (apart from Chromic and Plain Catgut) are included on the CE Mark (EU).
- Knot tying requires the standard surgical technique of flat and square ties with additional throws as indicated by surgical circumstance.
- A minimum order quantity may apply to all products.

Made in Australia
